

CAPE COD
COMMISSION

2019 Traffic Counting Report for Cape Cod Massachusetts

Prepared in cooperation with:

MASSACHUSETTS DEPARTMENT OF TRANSPORTATION
UNITED STATES DEPARTMENT OF TRANSPORTATION
FEDERAL HIGHWAY ADMINISTRATION

SEPTEMBER 2022

Executive Summary

The Cape Cod Commission (formerly the Cape Cod Planning and Economic Development Commission) has completed 36 summer seasons in the ongoing Traffic Counting Program. The Cape Cod Commission adds new locations and updates existing ones each year. Over 1,400 different locations on Cape Cod have been counted at least once, and over 6,754 counts have been performed since the program began. The result of the Traffic Counting Program is a useful database of traffic volume information for transportation planning.

In 2019, the Commission's Traffic Counting Program included 196 weekday automatic traffic recorder (ATR) counts, listed in Appendix A. Over a 10-year period (2009-2019), summer traffic Cape-wide has slightly increased an average 0.39% per year. The past year (2018-2019) has seen an overall increase in Cape-wide summer traffic of 2.15%. Data obtained from the Massachusetts Department of Transportation's permanent counting stations and are included in tables separate from the counts done by the Commission's program. This year, the Commission's staff also collected 7 weekend counts, which are included in Appendix C.

In addition to ATR counts, in total, the Traffic Counting Program has completed over 1,180 turning movement counts (TMCs), over 465 park-and-ride lot observations, and 82 bicycle and pedestrian studies. Year-round monthly data from the Commission's three remote counting stations (two in Harwich, one in Barnstable) provide a view of the seasonal traffic changes in the Mid- and Lower Cape sub-regions. Results of these efforts are presented in the Appendices D through H.

Local, state, and federal officials, engineers, transportation planners, and many other organizations and individuals use the traffic counting data. The information is used to perform traffic impact studies for new developments, analyze existing traffic demands on Cape Cod's roads, and identify ways to improve traffic flow and safety. The Commission expects to continue to expand and update this important database for transportation planning.

Acknowledgments

The Cape Cod Commission's transportation staff would like to thank the Federal Highway Administration, the Massachusetts Department of Transportation, and the County of Barnstable for providing the funding and support for this important transportation planning activity. The following individuals and organizations were instrumental in conducting this work:

Massachusetts Department of Transportation (MassDOT)

Stephanie Pollack, Secretary of Transportation and CEO

David Mohler, Executive Director, Office of Transportation Planning

Ben Muller, Cape Cod Liaison

Massachusetts Department of Transportation (MassDOT), Highway Division

Jonathan Gulliver, Administrator of Highway Division

Mary-Joe Perry, District 5 Highway Director

Steven O'Neill

Stephen Greene

Federal Highway Administration

Nelson Hoffman

Cape Cod Commission

Cape Cod Metropolitan Planning Organization

Cape Cod Joint Transportation Committee

The Cape Cod Commission's transportation staff would like to thank Sean Hilton, Alexis Sangeleer, and Matthew McCauley the Cape Cod Commission's traffic counting technicians for Summer 2019.

Prepared by the Cape Cod Commission Transportation Staff

Kristi Senatori, Executive Director

Patty Daley, Deputy Director

Steven M. Tupper, Transportation Program Manager

Lev A. Malakhoff, Senior Transportation Engineer

Colleen Medeiros, Transportation Engineer

David R. Nolan Jr, Transportation Planner

1. Introduction

This report summarizes traffic counts conducted between 2009 and 2019 by the Cape Cod Commission (previously the Cape Cod Planning and Economic Development Commission). Traffic count locations are selected based on recommendations from the Massachusetts Department of Transportation (MassDOT), town officials, members of the Cape Cod Joint Transportation Committee, and the Cape Cod Commission transportation staff.

Since 1989, the Commission staff has used automatic traffic recorders (ATRs) to conduct traffic counts. Earlier counts used “paper-punch” traffic counting equipment. ATR technology has advanced over the past decade to allow many different types of studies. All of the counters in the Commission’s ATR fleet now have the ability to do speed and classification studies, as well as volume counts. Simple collection of traffic volumes is still the most frequent type of study conducted by the Commission, but vehicle speed and vehicle classification studies are conducted upon request from MassDOT or local officials.

Cape Cod’s Traffic Counting Program began in 1984. Since the first count, the Commission staff has obtained 6,754 weekday counts and 699 weekend counts at over 1,400 different locations. In 2019, Commission staff collected 196 weekday counts and 7 weekend counts. Directional traffic volume counts were conducted at most of the locations where possible. Directional information is important when performing traffic studies because direction of travel can vary significantly by time of day. The Commission staff also fulfilled special requests such as vehicle speed and classification studies during the summer. The following table summarizes the activities of the Traffic Counting Program for the past 36 traffic counting seasons. Appendix A includes a summary of all ATR counts obtained in 2019.

CAPE COD
COMMISSION

Year	Weekday Counts	Weekend Counts	Total	New Locations
1984	70	0	70	70
1985	69	0	69	47

Table 1: CCC Traffic Counting Program Activity

2. Using the Traffic Counting Data

Appendix B contains all weekday traffic counts performed between 2009 and 2019. The traffic counts for each town are contained in individual data sets. At locations with directional volumes, the information is first provided for the total of both directions, with the directional volumes following below. Counts performed on numbered routes are listed first in numerical order. Subsequently, named streets are listed in alphabetical order. If a roadway has more than one name it may be necessary to look under both names for the desired information, such as Central Road and Great Neck Road North in the Town of Mashpee. Traffic count data followed by an asterisk (*) represents counts performed by MassDOT or another agency (e.g., the Town of Barnstable’s engineering department). These counts are primarily located on Route 6 and roads of local interest. Each column of data is explained in the sections that follow.

2.1. TOWN

Traffic counts are grouped by the town in which the count took place. The towns are ordered geographically, beginning with Bourne in the Upper Cape region and ending with Provincetown in the Outer Cape. A map of the town order is included in Appendix B to help navigate through the count data.

2.2. ROUTE/LOCATION INFORMATION

The roadway where the traffic count was taken is listed first for each count location. As part of the description, the orientation of the location with respect to the nearest cross street or notable geographic detail is also listed. For example, “Rt 3A S of Bour/Plym TL” is shorthand for “Route 3A, south of the Bourne/Plymouth town line.” Note that the counts performed on a town line are listed twice in the report. For each count location taken at a town line, the count location is given under both town names. This allows the data to be analyzed more effectively. For a

complete listing of abbreviated terms please refer to the Glossary of Abbreviations following the text of this report.

2.3. DATE OF STUDY: (YR), (BEGIN DATE), (END DATE)

Under each location, all available counts are listed in reverse chronological order, with the most recent appearing first. Year, Begin Date and End Date of a count are listed in the first three columns. Not all locations are counted every year, and some may be counted more than once in a given year. Generally, counts are conducted for a 48-hour period, although some cover longer periods. In order to monitor summer weekday traffic, most counts are conducted Monday through Friday during the summer season.

When comparing counts taken in different years, it is important to consider fluctuations in seasonal visitation to the area as well as year-to-year growth. For example, a July 2013 count will generally be higher than an April 2014 count, mainly because of the seasonal visitation differences. Even the comparison of a count performed in July 2013 to June 2014 could be misleading due to the increase in traffic experienced during the month of July. However, if a count conducted in April 2014 shows an increase over a count performed in July 2013, for example, the effect may be a result of area growth. Seasonal adjustment factors can allow for a better comparison of data between different months. See Section 5 for a greater description of seasonal adjustment factors.

Another variable to consider when comparing counts is the day(s) of the week in which the counts were performed. Comparison of weekend counts can also be used for estimating growth. However, a comparison of a count performed over a weekend and a count obtained during the weekdays could be misleading. Therefore, when estimating annual growth in traffic in an area, it is best to compare counts taken at the same location at the same time of year and on the same type of days (weekday or weekend). The Commission has separated weekday and weekend data into two different databases in order to prevent any confusion during analysis. No counts in Appendix B were performed on Saturdays, Sundays, or holidays. These weekend and holiday traffic counts are contained in Appendix C.

2.4. WEATHER CONDITIONS: (WEATHER)

Weather conditions may influence traffic volumes on Cape Cod. Cloudy days often contribute to increased traffic congestion except on beach access roads. On rainy or cloudy days, people engage in sightseeing or shopping rather than spending time at home or a favorite sunny-day location. In the data tables, brief descriptions of weather conditions during the count period are given. This information should be regarded with caution, as weather conditions may change considerably throughout a single day on Cape Cod. The Commission staff records the weather conditions of a count when setting down and picking up the traffic counting equipment. Of all the data provided in the tables, this category is the most subjective.

2.5. DIRECTION OF TRAVEL: (DIRECTION)

Direction identifies the direction of travel for the traffic on a roadway. Each traffic count is divided into three rows. The first row, “Total,” lists the data for the sum of the two directions. The next two rows list the directional data, with the direction of travel for the row indicated by the Direction column. If the count was done on a one-way road, only data for the one direction are listed and are identical to the information listed in the Total column. If the traffic counter did not separate the counts into the directional movements, only the data for the summation of both directions are listed.

2.5. SPEED MPH: (85TH PERCENTILE TRAFFIC SPEED)

Speed limits are typically based on the 85th percentile traffic speed (the maximum speed at which 85% of the vehicles are traveling). The measured 85th percentile speed can be different than the existing speed limit because of factors such as changes in geometric roadway geometry and driver behavior. All new ATR devices can determine the speed of vehicle traffic. The Cape Cod Commission has begun to record this figure at the request of town, staff or MassDOT officials. The data are presented for each direction of traffic. Practical uses of the data could include

evaluating the speed limit and safety of the roadway. 85th percentile speed can be found in appendices A & B.

2.6. AVERAGE DAILY TRAFFIC: (AXLE ADJ. ADT)

Average Daily Traffic (ADT) is an estimate of the average number of vehicles over a 24-hour period. Many of the older counters recorded pairs of “axle hits,” not vehicles. This meant that multiple-axle vehicles were counted as more than one vehicle (i.e., two 5-axle trucks were recorded as 5 vehicles). This method produced an estimated number of vehicles that was higher than the actual number. Axle correction factors are used to adjust, as necessary, the ATR data. See Section 4 for a more detailed description of axle correction factors.

2.7. PEAK HOUR DATA: (DATE&DAY), (HOUR), (VOL)

The Peak Hour is the highest one-hour traffic volume observed during the period counted. Three columns offer data on the Peak Hour of a count. The date and day of the week (Date&Day) in which the peak occurred is listed first. The hour of the day (Hour) representing the Peak Hour is listed in the second column using 24-hour time (e.g., “16” means that the Peak Hour occurred beginning at 4:00 p.m. and ending at 5:00 p.m.). The Peak Hour Volume (Vol) is listed in the third and right-most column. Please be aware that the two-way Peak Hour volume may not be equal to the sum of the two directional Peak Hour volumes. Instead, it may represent the hour within the period counted when the sum of traffic in both directions was greatest. Starting in 2011, peak hour volumes for each direction of travel correspond to the peak hour combined travel. This is to conform to MassDOT reporting requirements. Axle correction factors were used as necessary. Please see Section 4 for more information on axle correction factors.

Peak Hour information is significant for transportation planning. First, it indicates the highest traffic demands on a roadway. Second, it can show how close a roadway’s use is to its capacity. For example, if counts taken in different years or during different months of the same year indicate a change in average daily traffic without a corresponding change in Peak

Hour traffic, the roadway may be experiencing capacity constraints during peak times.

2.8. 4:00–5:00 P.M. TRAFFIC: (FOUR~FIVE)

The “Four~Five” column indicates the average traffic volume recorded between 4:00-5:00 p.m. during the count period. As with the other categories of data, the 4:00-5:00 p.m. volume is given for the total of both directions first, and then for each corresponding direction. The two-way 4:00-5:00 p.m. average volume is equal to the sum of the two directional 4:00-5:00 p.m. average volumes. Axle correction factors were used as necessary. Please see Section 4 for more information on axle correction factors.

The 4:00-5:00 p.m. volume has been included as an aid to transportation planners and engineers. In addition to these purposes, the 4:00-5:00 p.m. volume also provides useful information when compared to the Peak Hour volume for a particular location. For example, during the years 2004-2014, Cape-wide, the Peak Hour for the entire day generally fell between the hours of 4:00-5:00 p.m. (Rush Hour). The entire dataset supports this finding. It is still the case that the 4:00-5:00 p.m. volume is often the Peak Hour for the location.

2.9. ANNUAL AVERAGE DAILY TRAFFIC: (AADT)

The Annual Average Daily Traffic (AADT) is calculated by multiplying the ADT by a seasonal adjustment factor for the month of the count. MassDOT supplies these factors based on six permanent traffic-counting stations on Cape Cod. Note that this year-round AADT is only an estimate, based on seasonal changes in traffic volumes at these six locations. A description of the techniques used by MassDOT to develop the seasonal adjustment factors can be found in Section 5.

3. Weekend Traffic Counts

A feature added to this report in 1999 is a listing of traffic counts taken during weekends and holidays. Since then, the database has been expanded to include weekend counts performed in both earlier and later years. In 2019, 7 weekend counts were added for a total of 699 weekend counts recorded since the Traffic Counting Program began in 1984. This weekend database continues to grow each year and is included in Appendix C. Many of the headings are similar to those of the weekday database discussed in Section 2. The counts presented are representative of specific days and dates (Saturdays, Sundays, and holidays) and therefore have not been averaged or seasonally adjusted.

Counts are listed in geographical order, starting with Bourne and ending with Provincetown. Within each town's listing, counts are listed by route name. Counts performed on numbered routes are listed first in numerical order. Subsequently, named streets are listed in alphabetical order. If a roadway has more than one name it may be necessary to look under both names for the desired information, such as Central Road and Great Neck Road North in the Town of Mashpee.

3.1. DAILY TRAFFIC: ([SAT.], [SUN.], AND [HOLIDAY])

As with the Weekday Counts (see Section 2.6), Daily Traffic (DT) is an estimate of the average number of vehicles over a 24-hour period. Many of the older counters recorded pairs of "axle hits," not vehicles. This meant that multiple-axle vehicles were counted as more than one vehicle (i.e., two 5-axle trucks were recorded as 5 vehicles). This method produced an estimated number of vehicles that was higher than the actual number. Axle correction factors are used to adjust the ATR data, as necessary. See Section 4 for a more detailed description of axle correction factors.

Three columns list DT volumes. The first represents counts recorded on Saturdays. The second represents counts recorded on Sundays. The final column represents counts recorded during holidays, such as

Independence Day or Labor Day. Many counts do not contain information from all three categories. For each traffic count period, all available data are listed. None of the DT volumes have been seasonally adjusted, since counts performed on weekends and holidays are representative of specific days and not of annual data. For more information on seasonal adjustment factors, see Section 5.

3.2. PEAK HOUR DATA: ([SAT.], [SUN.], AND [HOLIDAY] VOLUME & TIME OF DAY)

As with the Weekday Counts (see Section 2.7), the Peak Hour is the highest one-hour traffic volume observed during the period counted. Peak Hour volumes and time of day are given for counts recorded on Saturdays, Sundays, and holidays. Using 24-hour time (e.g., “16” means that the Peak Hour occurred beginning at 4:00 p.m. and ending at 5:00 p.m.), the time of day representing the Peak Hour is listed in the right column of each day’s two-column set. The Peak Hour Volume is listed in the left column of each day’s two-column set. Please be aware that the two-way Peak Hour volume is not equal to the sum of the two directional Peak Hour volumes. Instead, it represents the hour within the period counted when the sum of traffic in both directions was greatest. Axle correction factors were used as necessary. Please see Section 4 for more information on axle correction factors.

Peak Hour information is significant for transportation planning. First, it indicates the highest traffic demands on a roadway. Second, it can show how close a roadway’s use is to its capacity. For example, if counts taken in different years or during different months of the same year indicate a change in average daily traffic without a corresponding change in Peak Hour traffic, the roadway may be experiencing capacity constraints during peak times.

4. Axle Correction

Standard volume counts by the Automatic Traffic Recorders (ATRs) record pairs of axle hits. The ATRs then divide the number of axles by two in order to estimate the volume of the road. This is called the “divide-by-two” method. However, not all vehicles have only two axles. Trucks, for example, can have from three to seven or more axles. A truck with three axles would be counted as 1.5 cars under the divide-by-two method. In order to obtain more accurate estimates, the data must be corrected to account for vehicles with multiple axles. Each year up to 2011 MassDOT has published a series of “axle correction factors.” The appropriate factor for each count must be determined based on the year of the count, the road classification of the count location, and whether the count location is within an urban area.

Classification and speed studies as well as volume counts performed by certain ATR models do not need to be axle corrected because they do not use the divide-by-two method. Instead, they record the actual number of vehicles traveling on a roadway. As a result, the counts included in the Appendices requiring axle correction have had the appropriate axle correction factor applied, while those counts not needing axle correction are unchanged.

Table 2: Axle Adjustment Factors for Cape Cod

	Rural Axle Factors							Urban Axle Factors							
	R-1	R-2	R-3	R-5	R-6	R-7	R-0	U-1	U-2	U-3	U-4	U-5	U-6	U-7	U-0

 *2011 is most recent year that factors have been supplied by MassDOT

5. MassDOT Data and Seasonal Adjustment Factors

Observed traffic volumes at a given location can often vary from month to month. This is especially true on Cape Cod, where summer traffic volumes are higher due to seasonal tourism. To compare traffic volume data collected in different months, seasonal adjustment factors must be applied.

5.1. PERMANENT TRAFFIC COUNTING STATIONS

MassDOT currently collects year-round traffic volumes from the following permanent traffic counting stations:

- Route 3 north of the Bourne/Plymouth town line
- Route 6 east of Route 149 (Exit 5)
- Route 6 at the Sagamore Bridge
- Route 28 at the Bourne Bridge
- Route 28 in Yarmouth, east of Higgins Crowell Road
- Route 28 in Barnstable, west of Old Post Road (Cotuit)

Also included in this report is a count station that discontinued in 1997:

- Route 28 in Barnstable, east of Main St (Cotuit)

Table 3, found on the following page, presents the Annual Average Daily Traffic (AADT) and summer Average Daily Traffic (ADT) for the Bourne and Sagamore Bridges for the last thirty years. Traffic data as old as the year 1969 is available on the Commission's transportation counts webpage: www.capecodcommission.org/counts

The table 4 presents the AADT and summer ADT for the other permanent traffic counting stations. The summer ADT for a particular year represents the July ADT of that year. If no traffic volumes for July were available, then the August ADT was used instead. Please note that data are not available for all years.

5.2. SEASONAL ADJUSTMENT FACTORS

Using the data collected from the permanent traffic counting stations, MassDOT determines the seasonal adjustment factors for the next year. These factors indicate relative traffic volumes throughout the year. For example, weekday traffic in January is approximately half the weekday traffic in July. By multiplying by the Average Daily Traffic (ADT) of a traffic count by a seasonal adjustment factor, an estimate of annual ADT can be produced for that location. ADT volumes from all months can in this way be converted into annual ADT volumes and properly compared.

The seasonal adjustment factors only produce an estimate of annual ADT for several reasons. First, the adjustment factors for 2012 and subsequent years are based on 2010 data, since MassDOT has not supplied monthly adjustment factors since 2011. Moreover, the permanent stations are located on state highways. Seasonal traffic fluctuations may be different on local roadways and streets. Also, none of the permanent stations are located east of Yarmouth. This is significant because seasonal traffic fluctuations are generally greater in areas with higher seasonal population changes, such as the Outer Cape.

For a complete listing of all seasonal adjustment factors from 1983-2011, please see the table on the following page.

Table 5: Monthly Adjustment Factors for Cape Cod

 *2011 is the last year that MassDOT has supplied monthly adjustment factors

6. Cape Cod Commission Remote Counting Stations

In addition to MassDOT permanent count stations, continuous, year-round data is collected at Cape Cod Commission remote count locations. At these locations' vehicle counts are recorded hourly for each approach lane of the intersection.

In 2011, one remote count location, Route 137 @ Route 39 in Harwich, was in operation. Following a system calibration in December 2010, a full year of data was collected in 2011 and most of 2012. A second location in Harwich, Route 124 at Queen Anne Road, became operational in July of 2012. An additional remote count location has been installed on Route 28 at Lumbert Mill Road in Barnstable and became operational in January 2013. Average year-round monthly and average summer month total entering vehicles are shown in the following table.

Table 6: Average Daily Traffic at Remote Data Collection Sites

	Harwich		Harwich		Barnstable	
	Rt 137/Rt 39 (2548)		Rt 124/Queen Anne Rd (2570)		Rt 28 E/Lumbert Mill Rd (2897)

2011	20,326	28,210				

*Year-round data is missing one or more months.

7. Results and Analysis

After seeing sustained growth for the second half of 20th century, traffic patterns on Cape Cod have been less consistent early in the 21st century. Over the last ten years (2009-2019), there has been an overall 3.99% increase in Cape-wide traffic.

7.1. MASSDOT PERMANENT COUNTING STATIONS AND BRIDGE CROSSINGS

MassDOT’s permanent counting stations can be used to show a trend in road usage over time. As can be seen in the following table, traffic volumes on Route 6 and Route 28 have decreased over the last ten years. Route 3 north of the Bourne/Plymouth town line has seen 6.26% growth since 2009. The Sagamore Bridge has seen 12.11% growth since 2009, while the Bourne Bridge has seen a negative growth of -2.32%. Due to equipment problems, not all stations were available for analysis. A new MassDOT counting station on Route 28 south of the Otis Rotary in Bourne became operational at the beginning of 2015 and is now included in growth calculations in this year’s report.

Table 7: Summer Growth Rates - Permanent Counting Stations and Bridge Crossings (%)

Permanent Traffic Counting Station	10 Year Total Growth	10 Year Average Annual Growth Rate	One Year Growth Rate 2018-2019
#15: Rt 6 E of Rt 149 (Ex. 5)	-4.30	-0.44	n/a
#20: Rt 3 N of Bourne TL	6.26	0.60	0.63
#707: Bourne Bridge	-2.32	-0.24	-0.12
#708: Sagamore Bridge	12.11	1.14	9.03
#709: Rt 28 E of Higgins Crowell	-7.44	-0.77	n/a
#7322: Rt 28 S of Otis Rotary	6.44	0.62	n/a
#7351: Rt 28 W of Old Post Rd	0.25	0.02	7.89

With the Bourne and Sagamore Bridges providing the primary access to and from Cape Cod, observing traffic trends at these stations can provide useful insight into annual and seasonal traffic trends. In total, over 35 million vehicles crossed the Cape Cod Canal on the Bourne or Sagamore Bridge in one year.

Traffic data have been collected at permanent count stations at both bridges since 1972. Carrying roughly twice as many vehicles today as in 1972, the story of traffic over the bridges is the story of traffic on Cape Cod.

As shown in the figure below, both summer and annual average daily traffic (ADT) over the bridges showed an overall upward trend from the early 1970's through the early 2000's, reaching a maximum in 2002. Traffic volumes, on average, dropped from 2002 to 2007 before trending slightly upward in recent years. This figure has not been updated since 2012 because traffic counters have not been able to supply consistent data throughout the year.

Figure 1: Combined Average Daily Traffic over Bourne and Sagamore Bridges

Seasonal traffic trends over the bridges have also changed considerably over the years. Since 1972, traffic has tended to be more spread out over 12 months as opposed to concentrated during the summer months. As shown in the following figure this trend, along with the overall increase in traffic, has resulted in 2011 traffic volumes throughout almost the entire year in excess of 1972 traffic volumes in the summer. There were a variety

of nine months of available data for 2018. These counts are displayed below to show the traffic volume trends along with 2011 for comparison.

Figure 2: Historic Monthly ADT Changes at the Bourne and Sagamore Bridges

The graph below shows the monthly volumes that were counted by Cape Cod Commission permanent counting stations in 2019. The intersection at Route 28 and Lumbert Mill Road in Barnstable showed the highest volumes of the three locations in each month. The location in Harwich shows traffic volumes closer to the amount shown Route 28 and Lumbert Mill Road in the July and August.

The intersection in Harwich, Route 124 at Queen Anne Road showed a larger increase in volume during the summer months. The intersection at Route 28 and Lumbert Mill Road showed more consistent volumes year-round.

7.2. CAPE-WIDE TRAFFIC

The chart below shows ten-year moving average traffic growth beginning the period 1988-1998. This chart has been updated using an improved methodology as compared to previous traffic counting reports. After several periods of positive growth, declines began in the period 1998-2008. The ten-year period between 2009 and 2019 shows a fourth period in a row with ten-year positive growth.

Figure 3: Percentage Change for 10-Year Periods

In 1999-2009, we see the most severe 10-year drop in traffic volumes since the CCC has been keeping track of the statistic (-9.64%). While one may be tempted to assume this means traffic has decreased in 2009 since 2008, it is important to remember that the 10-year period ending in 2008 includes comparisons beginning with 1998 – a year that had significantly lower traffic volumes than the year 1999. 1999 volumes are included in the 10-year analysis for 1999-2009 and contribute to the 10-year decline

for the period. Cape-wide traffic actually increased from 2008 to 2009 by 2.9%.

The following table shows the growth rates for various sub-regions and roads of Cape Cod over a 10-year period. The average annual growth rate between 2009 and 2019 is 3.99% for all of Cape Cod. From 2009 to 2019 all four regions on Cape Cod showed positive growth. Three of the four regions showed positive one-year growth, with the highest being the Lower-Cape.

Table 8: Cape Cod Summer Traffic Growth by Subregion

Region*	Number of Comparisons**	10-Year Total Growth (%)	10-Year Annual Average Growth Rate (%)	One-Year Growth Rate 2018-2019 (%)
Upper Cape	160	6.10	0.59	1.29
Mid-Cape	151	1.85	0.18	3.00
Lower Cape	108	2.42	0.23	4.07
Outer Cape	79	6.15	0.59	-4.52
All Roads	498	3.99	0.39	2.15

*Upper = Bourne, Sandwich, Falmouth, Mashpee | Mid = Barnstable, Yarmouth, Dennis
Lower = Harwich, Chatham, Brewster, Orleans | Outer = Eastham, Wellfleet, Truro, Provincetown

** Corresponds to ten-year analysis only

Regarding the modest traffic volume change from 2009 to 2019 (0.39% per year), it is unclear what is responsible for the stagnation. The Cape-wide population has shown a moderate decline during a portion of this time period (see following table), but conventional trip generators (commercial establishments, residences, etc.) have not been reduced.

Table 9: Barnstable County Population Estimate

	1990	2000	2010	% Change 2000-2010
Population	186,605	222,230	215,888	-2.85%

CAPE COD
COMMISSION

Appendices

The appendices contain traffic count data collected from 2009-2019. Appendix A includes a summary of all ATR counts obtained in 2019. Appendix B makes up the body of the Traffic Counting Report. It includes all Automatic Traffic Recorder counts obtained from 2009 to 2019, arranged geographically by town (starting in the Upper Cape area at Bourne and ending in the Outer Cape area at Provincetown). Appendix C includes a listing of counts taken on weekends arranged by town and then by route name. Appendix D is a collection of turning movement counts performed at Cape Cod intersections from 2009 to 2019. Appendix E summarizes bicycle pedestrian counts. Appendix F is a summary of park and ride lot capacity counts. Appendix F details data collected at the Cape Cod Commission remote monitoring locations since 2011.

CAPE COD
COMMISSION

Appendix D: Turning Movement Counts

Cape Cod Commission Traffic Counting Report 2018
Counts Conducted 2009-2019

CAPE COD TURNING MOVEMENT COUNTS 2009-2019

The Cape Cod Commission (and its predecessor, the Cape Cod Planning & Economic Development Commission) has collected and maintained a database of turning movement counts from Cape Cod intersections since 1988. The database includes over 1,000 observations. This report includes counts collected from the period 2009-2019 including 80 surveys during 2019. Traffic data over three years old are generally considered out-of-date as an input to traffic analyses but are included in this appendix as an aid to generating historic trends. These data are being provided for comparison purposes at intersections that have been counted more than once during the ten-year period and for consistency with the data available in the main text of the Cape Cod Traffic Counting Report.

The following are descriptions of the items included in this appendix:

Town: listed in contiguous geographic order used in main report (e.g., Bourne to Provincetown).

Major Road Name “E-W” or “N-S” @ Minor Road Name: shows general direction of travel of the major road. The direction north is considered up on the turning movement diagrams.

Site Code: a 4-digit identification number, unique to each intersection.

Date/Time of Study: includes beginning and ending times for observations (24-hour format).

Observed Peak Hour: the beginning time (24-hour format) of the busiest 60-minute period within the Observation period.

Report Hour: for most observations, this is the time period from 4 pm to 5 pm (listed as “16:00”). 16:00 has been identified to be the general “peak hour” for Cape Cod. If the Observation period did not include this 60-minute period, a different Report Hour is indicated. For weekday morning counts, 8:00 am is identified as the Report Hour.

Total Entering Volume: the total number of vehicles entering the intersection during the Report Hour.

CAPE COD
COMMISSION

Diagrams of Traffic Volumes: These figures show the total number of vehicles for each turning movement during the Report Hour. In some cases, “Partial Data” may be indicated if certain approaches/movements were not observed. Use with caution.

CAPE COD
COMMISSION

Appendix E: Bicycle/Pedestrian Counts

Cape Cod Commission Traffic Counting Report 2018
Counts Conducted 2009-2019

CAPE COD
COMMISSION

CAPE COD BICYCLE/PEDESTRIAN COUNTS

The Cape Cod Commission's Summer Traffic Counting Program performs bicycle and pedestrian counts at various multi-use path locations on Cape Cod as well as at numerous intersections during the course of recording turning movements. The data presented in this appendix include detailed data collected at Multi-Use Paths and simpler summary data collected at intersections. These data types are discussed below.

Multi-Use Path Data

Data collection techniques follow a uniform method used throughout the state, which includes distinguishing six specific categories of multi-use path users.

Each location is identified by a site code, listed on the data sheet as "BPSite#." All counts differentiate directional data using a two-letter abbreviation (EB = Eastbound, WB = Westbound, NB = Northbound, SB = Southbound). For user categories where helmets are applicable, calculations present the percent of users wearing a helmet. Boxes with blank values do not have applicable data.

The following descriptions explain the types of multi-use path users identified during the counts:

Bicyclists: These data include all users operating or contributing to the operation of a bicycle. A tandem bicycle operated by two people is counted as two bicyclists. A child being towed in a carrier is not considered a bicyclist. Some counts distinguish the number of helmeted bikers versus non-helmeted.

Skaters: Skaters are roller-skaters or in-line skaters. Some counts distinguish the number of helmeted bikers versus non-helmeted.

Walkers: This category includes all users walking on the multi-use path. This category may include people pushing a baby carriage or walking a pet (pets are not included in the count).

Joggers: This category includes all users jogging and running along the multi-use path.

CAPE COD
COMMISSION

Child in Carrier: This category refers to many different users. A Child in Carrier could be a child being pushed in a baby carriage, a child towed behind a bicycle in a carrier, or a child in a seat mounted to another bicycle (not a trailer).

Data are sorted by facility name. Please refer to the following examples to better understand user classification.

Two Bikers

Two Bikers

One Biker, one
Child in Carrier

One Walker, one
Child in Carrier

One Skater

One Biker,
two Child in Carrier

Other

Other

Other

Intersection Data

Cape Cod Commission staff perform a varying number of manual turning movement counts each year at intersections throughout Barnstable County. Observations are recorded typically starting at 4 p.m. and last for one and a half hours to two hours.

The data summarized in the appendix includes the following information:

- **Site Code**: unique identifier number for each intersection
- **Date/Time of Study**: shows day of week, date, and range of times when the data were collected.
- **Bicycles Observed during Study Period**
- **Pedestrians Observed during Study Period**
- **Estimated bikes/day**: this is a calculated value obtained by multiplying the hourly average number of bicyclists by 10.
- **Estimated pedestrians/day**: this is a calculated value obtained by multiplying the hourly average number of pedestrians by 10.

The data are grouped by town beginning with Bourne on the Upper Cape extending to Provincetown in the Outer Cape. Within each town the data are sorted alphabetically by major road.

CAPE COD
COMMISSION

Appendix F: Park and Ride Lot Counts

Cape Cod Commission Traffic Counting Report 2018
Counts Conducted 2009-2019

CAPE COD
COMMISSION

PARK AND RIDE LOT COUNTS

Cape Cod Commission technicians perform occupancy counts at three Cape Cod Park and Ride locations (Barnstable, Sagamore and Harwich). The map on the following page shows the approximate locations of the three Park and Ride lots.

The number of parked cars is counted, and the number of illegally parked cars is also noted. In the Park and Ride reports on the following pages, the number of cars is compared to the lot's capacity and a percentage of used capacity is calculated. The records in the database are grouped by lot then arranged from most recent to oldest.

CAPE COD
COMMISSION

Appendix E: Remote Counting Locations

Cape Cod Commission Traffic Counting Report 2018
Counts Conducted 2010-2019

REMOTE COUNTING LOCATIONS

Since December 2010, in-pavement traffic counting detectors have recorded vehicles on the approach lanes to the Route 137/Route 39 Intersection in Harwich. Due to a malfunction, traffic from the Route 39 eastbound approach is no longer being recorded correctly. Collectively, counts from the remaining lanes when added together result in a “Total Partial Entering Volume.”

In July of 2012, similar equipment became operational at the intersection of Route 124/Queen Anne Road also in the town of Harwich. An additional counting location became available in January of 2013 at the intersection of Route 28 and Lumbert Mill Road in the town of Barnstable. Collectively, counts from the from all approaches when added together result in the “Total Entering Volume.”

The data presented in this appendix include the traffic volumes for each day of the month beginning with December 2010 up to January 2019. When erroneous data occur or there are recording problems, temporary outages occur (these result in blanks for days when this occurs). The available days’ data are averaged together resulting in the “Monthly Average Daily Traffic.”
