Executive Summary

The Cape Cod Commission has completed 38 summer seasons in the ongoing Traffic Counting Program. Over 1,350 different locations on Cape Cod have been counted at least once, and over 7,300 counts have been performed since the program began. The Commission primarily conducts counts during the summer, which is the peak season for traffic volumes for the region. However, counts are also conducted in the off-peak seasons to help track changes. The result of the Traffic Counting Program is a useful database of traffic volume information for transportation planning.

In 2021, the Commission's Traffic Counting Program conducted 188 automatic traffic recorder (ATR) counts on Cape Cod, which are included in Appendix A. The one-year average annual growth rate (2020-2021) was calculated to be 10.45% for the entire region while the 10-year average annual growth rate (2012-2021) was calculated to be -0.81%. From 2012 to 2021 all four sub regions on Cape Cod showed negative growth. However, in the latest period, three of the four regions showed positive one-year growth (2020-2021), with the highest being the Upper Cape. Over a 10-year period (2012-2021), summer traffic Cape-wide has decreased an average of -0.82% per year. The past year (2020-2021) has seen an overall increase in Cape-wide summer traffic of 12.62%. The 10-year period (2012-2021) Commission ATR counts are listed in Appendix B by town. It is important to note that the COVID-19 pandemic peaked in the Summer of 2020, making it challenging to compare 2020 and 2021 data to each other. Data obtained from the Massachusetts Department of Transportation's permanent counting stations are included in tables separate from the counts done by the Commission's program.

In addition to ATR counts, the Traffic Counting Program has completed over 1,220 turning movement counts (TMCs), over 500 park-and-ride lot observations, and over 90 bicycle and pedestrian studies. Year-round monthly data from the Commission's three remote counting stations (two in Harwich, one in Barnstable) provide a view of the seasonal traffic changes in the Mid- and Lower Cape sub-regions. Results of these efforts are presented in Appendices C through E.

Local, state, and federal officials, engineers, transportation planners, and many other organizations and individuals use the traffic counting data. The information is used to perform traffic impact studies for new developments, analyze existing traffic demands on Cape Cod's roads, and identify ways to improve traffic flow and safety. The Commission expects to continue to expand and update this important database for transportation planning.

Acknowledgements

The Cape Cod Commission's transportation staff would like to thank the Federal Highway Administration, the Massachusetts Department of Transportation, and the County of Barnstable for providing the funding and support for this important transportation planning activity.

Cape Cod Commission Project Team

Project Coordinator: Evan Costa, Transportation Planner

Project Coordinator: David Nolan, Senior Transportation Planner

Colleen Medeiros, Transportation Program Manager and Transportation Engineer

The Cape Cod Commission's transportation staff would like to thank Luke Carey and Corey Velho, the Cape Cod Commission's traffic counting technicians for Summer 2021.

The information presented on the maps and figures in this report are for planning purposes only. They are not adequate for legal boundary definition, regulatory interpretation, or parcel level analysis. They should not substitute for actual on-site surveys or supersede deed research.

Introduction

This report summarizes traffic counts conducted between 2012 and 2021 by the Cape Cod Commission. Traffic count locations are selected based on recommendations from the Massachusetts Department of Transportation (MassDOT), town officials, members of the Cape Cod Joint Transportation Committee, and the Cape Cod Commission transportation staff.

Since 1989, the Commission staff has used automatic traffic recorders (ATRs) to conduct traffic counts. ATR technology has advanced over the past decade to allow many different types of studies. The two most common forms of ATRs Commission staff utilize are the pneumatic roadway tubes and radar-based traffic recorders. The major difference between these counter methods is that the pneumatic road tube counters collect vehicle classification data in addition to volume and speed. The radar counters that Commission staff use only collect volume and speed. The collection of traffic volumes is the most frequent type of study conducted by the Commission, but vehicle speed and vehicle classification studies are conducted upon request from MassDOT or local officials.

Cape Cod's Traffic Counting Program began in 1984. Since the first count, the Commission staff has obtained 7,090 counts at over 1,350 different locations. In 2021, Commission staff collected 188 ATR counts using traditional pneumatic roadway tubes to collect data as well as new radar-based traffic recorders attached to utility poles along the roadway. Directional traffic volume counts were conducted at most of the locations where possible. Directional information is important when performing traffic studies because direction of travel can vary significantly by time of day. The Commission staff also fulfilled special requests such as vehicle speed and classification studies during the summer. The following table summarizes the activities of the Traffic Counting Program for the past 38 traffic counting seasons. Appendix A includes a summary of all ATR counts obtained in 2021.

Year	Weekday Counts	Weekend Counts	Total
1984	70	0	70

Table 1: CCC Traffic Counting Program Activity

Using The Traffic Counting Data

Appendix B contains all weekday traffic counts performed between 2012 and 2021. The traffic counts for each town are contained in individual data sets. At locations with directional volumes, the information is first provided for the total of both directions, with the directional volumes following below. Counts performed on numbered routes are listed first in numerical order. Subsequently, named streets are listed in alphabetical order.

TOWN

Traffic counts are grouped by the town in which the count took place. The towns are sorted geographically, beginning with Bourne in the Upper Cape sub-region, and ending with Provincetown in the Outer Cape. A map of the town order is included in Appendix B to help navigate through the count data.

ROUTE/LOCATION INFORMATION

The roadway where the traffic count was taken is listed first for each count location. As part of the description, the orientation of the location with respect to the nearest cross street or notable geographic detail is also listed. For example, "Rt 3A S of Bour/Plym TL" is shorthand for "Route 3A, south of the Bourne/Plymouth town line." Note that the counts performed on a town line are listed twice in the report. For each location at a town line, the count location is given under both town names. This allows the data to be analyzed more effectively. For a complete listing of abbreviated terms please refer to the Glossary of Abbreviations following the text of this report.

DATE OF STUDY: (YR), (BEGIN DATE), (END DATE)

Under each location, all available counts are listed in reverse chronological order, with the most recent appearing first. Year, Begin Date and End Date of a count are listed in the first three columns. Not all locations are counted every year, and some may be counted more than once each year. Generally, counts are conducted for a 48-hour period, although some cover longer periods. To monitor summer weekday traffic, most counts are conducted Monday through Friday during the summer season.

When comparing counts taken in different years, it is important to consider fluctuations in seasonal visitation to the area as well as year-to-year growth. For example, a July 2013 count will generally be higher than an April 2014 count, mainly because of the seasonal visitation differences. Even the comparison of a count performed in July 2013 to June 2014 could be misleading due to the increase in traffic experienced during the month of July. However, if a count conducted in April 2014 shows

an increase over a count performed in July 2013, for example, the effect may be a result of area growth. Seasonal adjustment factors can allow for a better comparison of data between different months. See Section 5 for a greater description of seasonal adjustment factors.

Another variable to consider when comparing counts is the day(s) of the week in which the counts were performed. Comparison of weekend counts can also be used for estimating growth. However, a comparison of a count performed over a weekend and a count obtained during the weekdays could be misleading. Therefore, when estimating annual growth in traffic in an area, it is best to compare counts taken at the same location at the same time of year and on the same type of days (weekday or weekend).

WEATHER CONDITIONS: (WEATHER)

Weather conditions may influence traffic volumes on Cape Cod. Cloudy days often contribute to increased traffic congestion except on beach access roads. On rainy or cloudy days, people engage in sightseeing or shopping rather than spending time at home or a favorite sunny-day location. In the data tables, brief descriptions of weather conditions during the count period are given. This information should be regarded with caution, as weather conditions may change considerably throughout a single day on Cape Cod. The Commission staff records the weather conditions of a count when setting down and picking up the traffic counting equipment. Of all the data provided in the tables, this category is the most subjective.

DIRECTION OF TRAVEL: (DIRECTION)

Direction identifies the direction of travel for the traffic on a roadway. Each traffic count is divided into three rows. The first row, "Total," lists the data for the sum of the two directions. The next two rows list the directional data, with the direction of travel for the row indicated by the Direction column. If the count was done on a one-way road, only data for the one direction are listed and are identical to the information listed in the Total column. If the traffic counter did not separate the counts into the directional movements, only the data for the summation of both directions are listed.

SPEED MPH: (85TH PERCENTILE TRAFFIC SPEED)

Speed limits are typically based on the 85th percentile traffic speed (the maximum speed at which 85% of the vehicles are traveling). The measured 85th percentile speed can be different than the existing speed limit because of factors such as changes in geometric roadway geometry and driver behavior. All new ATR devices can determine the speed of vehicle traffic. The Cape Cod Commission has begun to record this figure at the request of town, staff or MassDOT officials. The data are

presented for each direction of traffic. Practical uses of the data could include evaluating the speed limit and safety of the roadway. 85th percentile speed can be found in appendices A & B.

AVERAGE DAILY TRAFFIC: (AXLE ADJ. ADT)

Average Daily Traffic (ADT) is an estimate of the average number of vehicles over a 24-hour period. Many of the older counters recorded pairs of “axle hits,” not vehicles. This meant that multiple-axle vehicles were counted as more than one vehicle (i.e., two 5-axle trucks were recorded as 5 vehicles). This method produced an estimated number of vehicles that was higher than the actual number. Axle correction factors are used to adjust, as necessary, the ATR data. See Axle Correction for a more detailed description of axle correction factors.

PEAK HOUR DATA: (DATE&DAY), (HOUR), (VOL)

The Peak Hour is the highest one-hour traffic volume observed during the period counted. Three columns offer data on the Peak Hour of a count. The date and day of the week (Date&Day) in which the peak occurred is listed first. The hour of the day (Hour) representing the Peak Hour is listed in the second column using 24-hour time (e.g., “16” means that the Peak Hour occurred beginning at 4:00 p.m. and ending at 5:00 p.m.). The Peak Hour Volume (Vol) is listed in the third and right-most column. Please be aware that the two-way Peak Hour volume may not be equal to the sum of the two directional Peak Hour volumes. Instead, it may represent the hour within the period counted when the sum of traffic in both directions was greatest. Starting in 2011, peak hour volumes for each direction of travel correspond to the peak hour combined travel. This is to conform to MassDOT reporting requirements. Axle correction factors were used as necessary. Please see Axle Correction for more information on axle correction factors.

Peak Hour information is significant for transportation planning. First, it indicates the highest traffic demands on a roadway. Second, it can show how close a roadway’s use is to its capacity. For example, if counts taken in different years or during different months of the same year indicate a change in average daily traffic without a corresponding change in Peak Hour traffic, the roadway may be experiencing capacity constraints during peak times.

4:00-5:00 P.M. TRAFFIC: (FOUR~FIVE)

The “Four~Five” column indicates the average traffic volume recorded between 4:00-5:00 p.m. during the count period. As with the other categories of data, the 4:00-5:00 p.m. volume is given for the total of both directions first, and then for each corresponding direction. The two-way 4:00-5:00 p.m. average volume is equal to the sum of the two directional 4:00-5:00 p.m. average volumes. Axle correction factors were used as necessary. Please see Axle Correction for more information on axle correction factors.

The 4:00-5:00 p.m. volume has been included as an aid to transportation planners and engineers. In addition to these purposes, the 4:00-5:00 p.m. volume also provides useful information when compared to the Peak Hour volume for a particular location. For example, during the years 2004-2014, Cape-wide, the Peak Hour for the entire day generally fell between the hours of 4:00-5:00 p.m. (Rush Hour). The entire dataset supports this finding. It is still the case that the 4:00-5:00 p.m. volume is often the Peak Hour for the location.

ANNUAL AVERAGE DAILY TRAFFIC: (AADT)

The Annual Average Daily Traffic (AADT) is calculated by multiplying the ADT by a seasonal adjustment factor for the month of the count. MassDOT supplies these factors based on six permanent traffic-counting stations on Cape Cod. Note that this year-round AADT is only an estimate, based on seasonal changes in traffic volumes at these six locations. A description of the techniques used by MassDOT to develop the seasonal adjustment factors can be found in the MassDOT Data and Seasonal Adjustment Factors section.

Axle Correction

Standard volume counts by the Automatic Traffic Recorders (ATRs) record pairs of axle hits. The ATRs then divide the number of axles by two to estimate the volume of the road. This is called the “divide-by-two” method. However, not all vehicles have only two axles. Trucks, for example, can have from three to seven or more axles. A truck with three axles would be counted as 1.5 cars under the divide-by-two method. To obtain more accurate estimates, the data must be corrected to account for vehicles with multiple axles. To account for this, MassDOT publishes a series of “axle correction factors”. The most recent correction factors can be found in Table 2. The appropriate factor for each count must be determined based on the year of the count, the road classification of the count location, and whether the count location is within an urban area. The adjustment factors from 2012 through till 2013 are based on 2011 factors, since MassDOT had not supplied monthly adjustment factors since 2011. Additionally, the adjustment factors from 2020 to 2021 are based on 2019 factors as MassDOT had not supplied monthly adjustment factors since 2019.

Classification and speed studies as well as volume counts performed by certain ATR models do not need to be axle corrected because they do not use the divide-by-two method. Instead, they record the actual number of vehicles traveling on a roadway. As a result, the counts included in the Appendices requiring axle correction have had the appropriate axle correction factor applied, while those counts not needing axle correction are unchanged.

MassDOT Data and Seasonal Adjustment Factors

Observed traffic volumes at a given location can often vary from month to month. This is especially true on Cape Cod, where summer traffic volumes are higher due to seasonal tourism. To compare traffic volume data collected in different months, seasonal adjustment factors must be applied.

PERMANENT TRAFFIC COUNTING STATIONS

MassDOT currently collects year-round traffic volumes from the following permanent traffic counting stations:

- Route 3 north of the Bourne/Plymouth town line
- Route 6 east of Route 149 (Exit 5)
- Route 6 at the Sagamore Bridge
- Route 28 at the Bourne Bridge
- Route 28 in Yarmouth, east of Higgins Crowell Road
- Route 28 in Barnstable, west of Old Post Road (Cotuit)

Also included in this report is a count station that discontinued in 1997:

- Route 28 in Barnstable, east of Main St (Cotuit)

Table 3, found on the following page, presents the Annual Average Daily Traffic (AADT) and summer Average Daily Traffic (ADT) for the Bourne and Sagamore Bridges for the last twenty-five years. Please note that data is not available for all years. Traffic data as old as the year 1969 is available on the Commission's transportation counts webpage: <https://www.capecodcommission.org/our-work/traffic-counts/>

Table 4 presents the AADT and summer ADT for the other permanent traffic counting stations for the last twenty-five years. The summer ADT for a particular year represents the July ADT of that year. If no traffic volumes for July were available, then the August ADT was used instead. Please note that data at certain locations is not available for every year.

SEASONAL ADJUSTMENT FACTORS

Using the data collected from the permanent traffic counting stations, MassDOT determines the seasonal adjustment factors for the next year. These factors indicate relative traffic volumes throughout the year. For example, weekday traffic in January is approximately half the weekday traffic in July. By multiplying by the Average Daily Traffic (ADT) of a traffic count by a seasonal adjustment factor, an estimate of annual ADT can be produced for that location. ADT volumes from all months can in this way be converted into annual ADT volumes and properly compared. The most recent MassDOT adjustment factors are from 2019, which, as well as the factors from previous years can be found in Table 5.

Table 5: Monthly Adjustment Factors for Cape Cod

Source: MassDOT

*2011 values used; **2019 values used

The seasonal adjustment factors only produce an estimate of annual ADT for several reasons. First, the seasonal adjustment factors from 2012 through till 2015 are based on 2011 factors, since MassDOT had not supplied monthly adjustment factors since 2011. Additionally, the adjustment factors from 2020 till 2021 are based on 2019 factors as MassDOT had not supplied monthly adjustment factors since 2019. Second, the permanent stations are located on state highways. Seasonal traffic fluctuations may be different on local roadways and streets. Third, none of the permanent stations are located east of Yarmouth. This is significant because seasonal traffic fluctuations are generally greater in areas with higher seasonal population changes, such as the Outer Cape.

Cape Cod Commission Remote Counting Stations

In addition to MassDOT permanent count stations, continuous, year-round data is collected at Cape Cod Commission remote count locations. At each of these locations, vehicle counts are recorded hourly for each approaching lane of the intersection. In 2010, only one remote count location, Route 137 at Route 39 in Harwich, was in operation. Following a system calibration in December 2010, data was collected in 2011 and most of 2012. A second location in Harwich, Route 124 at Queen Anne Road, became operational in July of 2012. An additional remote count location has been installed on Route 28 at Lumbert Mill Road in Barnstable and became operational in January 2013. The average year-round monthly and average summer month total entering vehicles are shown for these locations in Table 6 for the past ten years. The average summer month data is from the peak months of July and August.

Table 6: CCC Remote Count Locations

*Summer data is missing one or more months

Results and Analysis

After seeing sustained growth for the second half of 20th century, traffic patterns on Cape Cod have been less consistent early in the 21st century. Over the last ten years (2012-2021), there has been an overall decrease in Cape-wide traffic. The 10-year annual average growth rate for all roads Cape-wide is -0.81%

MASSDOT PERMANENT COUNTING STATIONS AND BRIDGE CROSSINGS

MassDOT's permanent counting stations can be used to show a trend in road usage over time. As can be seen in Table 7, traffic volumes on Route 6 and Route 28 have had minimal change over the last ten years, with a 10-year average annual growth rate (2012-2021) of 0.49%. While in the past year alone the one-year growth rate (2020-2021) has seen an average growth of 14.56% over all MassDOT stations. Route 3 north of the Bourne/Plymouth town line has seen a 10-year average annual growth of 0.54%. The Sagamore Bridge has seen a 10-year average annual growth of 1.14%, while the Bourne Bridge has seen a negative growth of -0.14%. Due to equipment problems, not all stations were available for analysis.

Table 7: Summer Growth Rates – Permanent Counting Stations and Bridge Crossings (%)

Permanent Traffic Counting Station	10-Year Average Annual Growth Rate (2012-2021)	One Year Growth Rate (2020-2021)
#15: Rt 6 E of Rt 149 (Ex. 5)	n/a	n/a
#20: Rt 3 N of Bourne TL	0.54%	10.62%
#707: Bourne Bridge	-0.14%	23.47%
#708: Sagamore Bridge	1.14%	10.54%
#709: Rt 28 E of Higgins Crowell	0.41%	13.63%
#7351: Rt 28 W of Old Post Rd*	-0.72%	6.41%
All MassDOT Stations**	0.49%	14.56%

*Site #7351 growth estimates are based on nine years 2013-2021

**Does not include site #15 (due to incomplete data)

With the Bourne and Sagamore Bridges providing the primary access to and from Cape Cod, observing traffic trends at these stations can provide useful insight into annual and seasonal traffic trends. Annually, more than 35 million vehicles cross the two bridges. Translating to about 18 million vehicles cross the Sagamore Bridge, and about 17 million vehicles cross the Bourne Bridge.

BRIDGE DATA THROUGH THE YEARS

Traffic data has been collected at permanent count stations at both bridges since 1972. Carrying roughly twice as many vehicles today as in 1972, the story of traffic over the bridges is the story of traffic on Cape Cod.

Figure 1 shows both summer and annual average daily traffic (ADT) over the bridges. Overall, there was an upward trend from the early 1970's through to the early 2000's, reaching a maximum in 2002. Traffic volumes, on average, dropped from 2002 to 2007 before trending slightly upward in the early 2010s. This figure is missing data from 2013 to 2019 due to traffic counters not being able to supply consistent data throughout those years. Since the COVID-19 Pandemic in 2020, there was a major dip in ADT over the Bourne and Sagamore Bridges as most of the country experienced lockdowns and or were placed in quarantine. In 2020, the ADT over the bridges was close to the same amount as in 1990 and 1991. Since the initial start of the pandemic, the ADT in this location has seen a new maximum, in 2021, and has since started to level out to the same ADT range as the early 2000s and the 2010s.

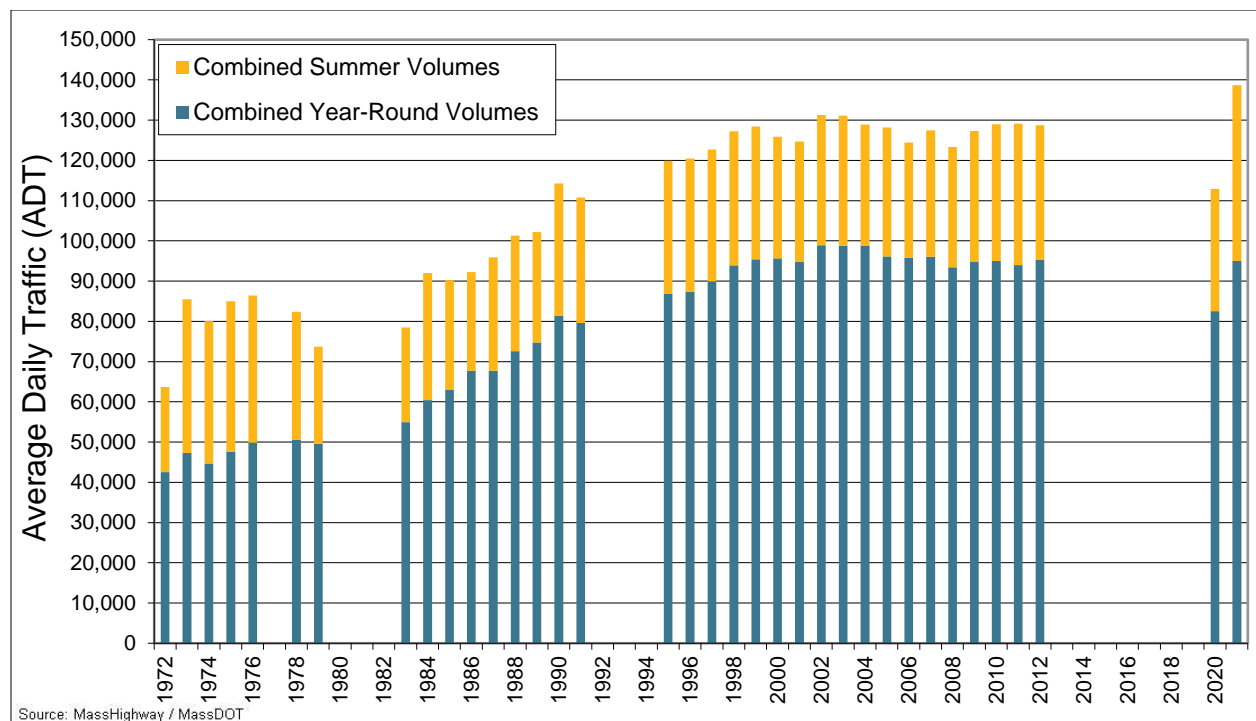

Figure 1: Combined Average Daily Traffic over Bourne and Sagamore Bridges

Seasonal traffic volumes over the bridges have also changed considerably over the years. Figure 2 shows ADT from 1972, 2011, 2018 and 2021. In just the past decade alone, ADT has nearly doubled for every month when compared to ADT from 1972. ADT has continued to rise into the 2020s.

Despite the increase, trends have remained similar; peak season months receive higher ADT than non-peak season months. The 2021 ADT for each month is displayed, as that is the latest yearly ADT data available for contrast. Data for 2011 and 2018 are displayed alongside the 2021 data to show the traffic volume comparison between the latest decades.

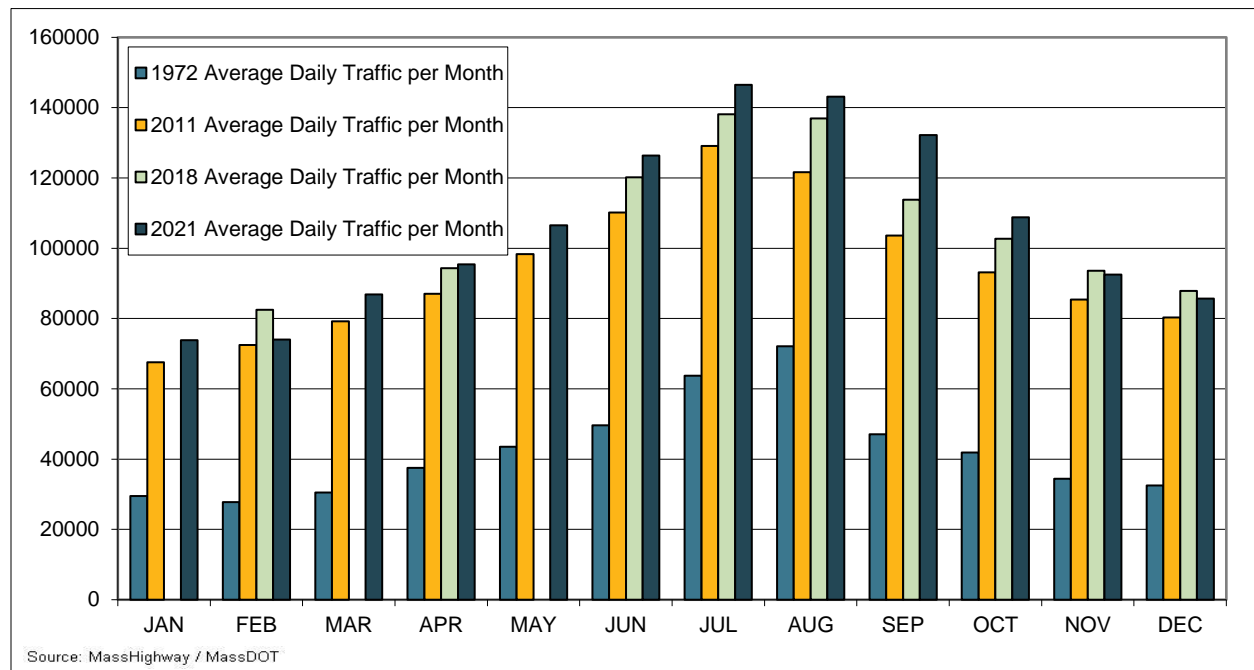

Figure 2: Historic Monthly ADT Changes at the Bourne and Sagamore Bridges

BRIDGE DATA DURING COVID-19

Traffic patterns in Barnstable County reflect the ebb and flow of the region’s seasonal and tourism-driven economy, which brings a surge of visitors in the peak summer months and on weekends. In 2020, the COVID-19 pandemic disrupted the typical traffic trends. Following mass business closures and social distancing measures implemented in March 2020, traffic volumes over the Bourne and Sagamore bridges dropped significantly, with downward trends continuing throughout April. In May, traffic numbers, while still lower than usual, began to rebound. Traffic over both bridges was still down by 31% in May 2020 as compared to the year prior and down by 13% in June 2020. Numbers continued to return to normal levels throughout the 2020 summer season. By 2021, traffic exceeded pre-pandemic levels over the two canal bridges in the summer and fall months.

CAPE COD COMMISSION PERMANENT STATIONS

The following figure, Figure 3, shows the monthly volumes that were counted by Cape Cod Commission permanent counting stations in 2021. The intersection at Route 28 and Lumbert Mill Road in Barnstable showed the highest volumes of the three locations in each month. The location

in Harwich shows traffic volumes closer to the amount shown Route 28 and Lumbert Mill Road in July and August.

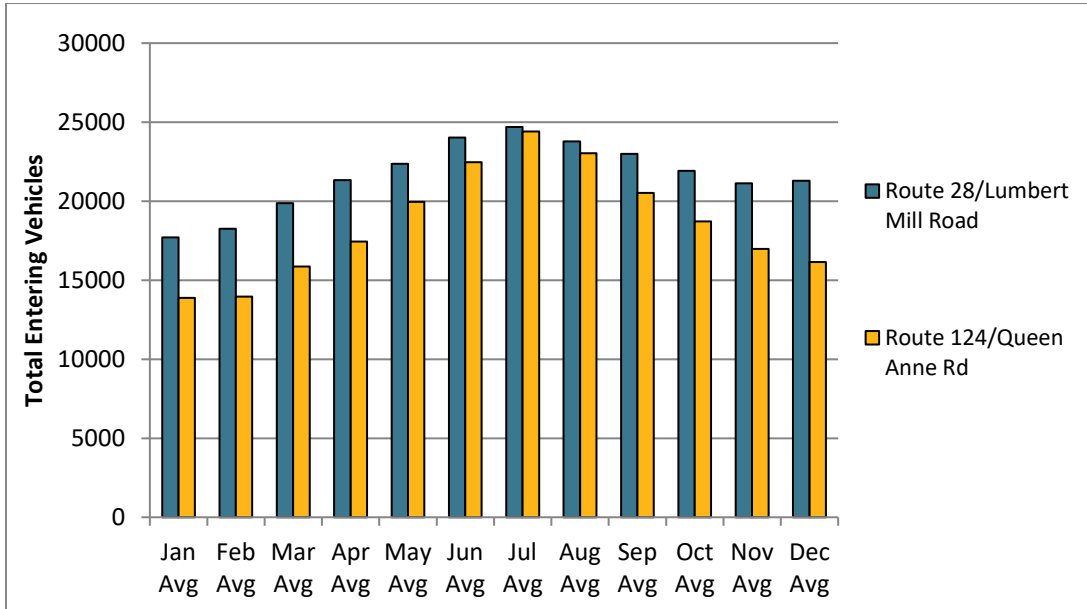

Figure 3: Cape Cod Commission Permanent Counter Data - 2021

The intersection in Harwich, Route 124 at Queen Anne Road, showed a larger increase in volume during the summer months. The intersection at Route 28 and Lumbert Mill Road showed more consistent volumes year-round. These counters are helpful when looking at volume changes and growth across the region.

CAPE-WIDE TRAFFIC GROWTH

The following table, Table 8, shows the growth rates for the various sub-regions of Cape Cod over a 10-year period. The 10-year average annual growth rate between 2012 and 2021 is -0.81% for all of Cape Cod. From 2012 to 2021 all four regions on Cape Cod showed negative growth. Three of the four regions showed positive one-year growth, with the highest being the Upper Cape.

Table 8: Cape Cod Traffic Growth by Subregion

Region*	Number of Comparisons**	10-Year Annual Average Growth Rate (2012-2021)	One-Year Growth Rate (2020-2021)
Upper Cape	80	-0.44%	18.15%
Mid-Cape	80	-0.75%	-1.74%
Lower Cape	59	-1.01%	11.54%
Outer Cape	27	-1.60%	8.40%
All Roads	246	-0.81%	10.45%

*Upper = Bourne, Sandwich, Falmouth, Mashpee | Mid = Barnstable, Yarmouth, Dennis | Lower = Harwich, Chatham, Brewster, Orleans | Outer = Eastham, Wellfleet, Truro, Provincetown

**Corresponds to ten-year analysis only

Regarding the slight decline in traffic volume from 2012 to 2021 across the Cape, one of the major contributors of this decline could be the from the Covid-19 Pandemic. The Covid-19 Pandemic had a significant impact on the decline of traffic volume in 2020 and 2021, which would in turn lead to an overall decrease in the 10-year annual average growth. It is interesting to note that traffic volumes did come back to normal and even exceeded normal amounts in some areas in 2021, which would account for the positive one-year growth that many subregions experienced.

The Covid-19 Pandemic caused severe social and economic disruption around the world as well as locally on Cape Cod. Public areas and educational institutions were either partially or fully closed in many jurisdictions, and many events were cancelled or postponed during 2020 and 2021. Telework also became a much more common form of work during the pandemic, which further reduced trips to places of work. The Cape-wide population has shown a moderate increase during a portion of this period (see Table 9), which could help to explain why trip generators (commercial establishments, residences, etc.) have not been reduced.

Traffic surged during the Summer and Fall of 2021 due to changes on travel restrictions, social distancing measures, and public areas opening back up after mass closure. The public began to travel again, and this created a visible increase in traffic. A one-year average growth rate of 10.45% was observed region wide when comparing volumes from 2020 to 2021. As traffic patterns begin to level out, it will be important to track impacts to transportation modes and traffic region wide.

Table 9: Barnstable County Population Estimate

	1990	2000	2010	2020	% Change 2010-2020
Population	186,605	222,230	215,888	228,996	6.07%

TEV	TOTAL ENTERING VEHICLES
WB	WESTBOUND

Appendices

The appendices contain traffic count data collected from 2012-2021. Appendix A includes a summary of all ATR counts obtained in 2021. Appendix B makes up the body of the Traffic Counting Report. It includes all Automatic Traffic Recorder (ATR) counts obtained from 2012 to 2021, arranged geographically by town (starting in the Upper Cape area at Bourne and ending in the Outer Cape area at Provincetown). Appendix C is a collection of turning movement counts performed at Cape Cod intersections from 2012 to 2021. Appendix D summarizes bicycle pedestrian counts. Appendix E is a summary of park and ride lot capacity counts.

APPENDIX C: 2012-2021 TURNING MOVEMENT COUNTS

The Cape Cod Commission has collected and maintained a database of turning movement counts from Cape Cod intersections since 1988. The database includes well over 1,000 observations. This report includes counts collected from the period 2012-2021. Traffic data over three years old are generally considered out-of-date as an input to traffic analyses but are included in this appendix as an aid to generating historic trends. This data is being provided for comparison purposes at intersections that have been counted more than once during the ten-year period and for consistency with the data available in the main text of the Cape Cod Traffic Counting Report. The following are descriptions of the items included in this appendix:

- Town: listed in contiguous geographic order used in main report (e.g., Bourne to Provincetown).
- Major Road Name “E-W” or “N-S” @ Minor Road Name: shows general direction of travel of the major road. The direction north is considered up on the turning movement diagrams.
- Site Code: a 4-digit identification number, unique to each intersection.
- Date/Time of Study: includes beginning and ending times for observations (24-hour format).
- Observed Peak Hour: the beginning time (24-hour format) of the busiest 60-minute period within the Observation period.
- Report Hour: for most observations, this is the period from 4 pm to 5 pm (listed as “16:00”). 16:00 has been identified to be the general “peak hour” for Cape Cod. If the observation period did not include this 60-minute period, a different Report Hour is indicated. For weekday morning counts, 8:00 am is identified as the Report Hour.
- Total Entering Volume: the total number of vehicles entering the intersection during the Report Hour.
- Diagrams of Traffic Volumes: These figures show the total number of vehicles for each turning movement during the Report Hour. In some cases, “Partial Data” may be indicated if certain approaches/movements were not observed. Use diagrams with caution.

APPENDIX D: 2012-2021 BICYCLE/PEDESTRIAN COUNTS

The Cape Cod Commission's Summer Traffic Counting Program performs bicycle and pedestrian counts at various multi-use path locations on Cape Cod as well as at numerous intersections while recording turning movements. The data presented in this appendix include detailed data collected at Multi-Use Paths and simpler summary data collected at intersections. These data types are discussed below.

Multi-Use Path Data

Data collection techniques follow a uniform method used throughout the state, which includes distinguishing six specific categories of multi-use path users. Each location is identified by a site code, listed on the data sheet as "BPSite#." All counts differentiate directional data using a two-letter abbreviation (EB = Eastbound, WB = Westbound, NB = Northbound, SB = Southbound). For user categories where helmets are applicable, calculations present the percentage of users wearing a helmet. Boxes with blank values do not have applicable data. The following descriptions explain the types of multi-use path users identified during the counts:

- **Bicyclists:** These data include all users operating or contributing to the operation of a bicycle. A tandem bicycle operated by two people is counted as two bicyclists. A child being towed in a carrier is not considered a bicyclist. Some counts distinguish the number of helmeted bikers versus non-helmeted bikers.
- **Skaters:** Skaters are roller-skaters or in-line skaters.
- **Walkers:** This category includes all users walking on the multi-use path. This category may include people pushing a baby carriage or walking a pet (pets are not included in the count).
- **Joggers:** This category includes all users jogging and running along the multi-use path.
- **Child in Carrier:** This category refers to many different users. A Child in Carrier could be a child being pushed in a baby carriage, a child towed behind a bicycle in a carrier, or a child in a seat mounted to another bicycle (not a trailer).

Data is sorted by facility name. Please refer to the following data to better understand user classification.

Intersection Data

Cape Cod Commission staff perform a varying number of turning movement counts manually each year at intersections throughout Barnstable County. Observations are recorded typically starting at 4 p.m. and last for one and a half hours to two hours. The data summarized in the appendix includes the following information:

- Site Code: unique identifier number for each intersection
- Date/Time of Study: shows day of week, date, and range of times when the data were collected.
- Bicycles Observed during Study Period
- Pedestrians Observed during Study Period
- Estimated bikes/day: this is a calculated value obtained by multiplying the hourly average number of bicyclists by 10.
- Estimated pedestrians/day: this is a calculated value obtained by multiplying the hourly average number of pedestrians by 10.

The data are grouped by town beginning with Bourne on the Upper Cape extending to Provincetown in the Outer Cape. Within each town the data are sorted alphabetically by major road.

APPENDIX E: PARK AND RIDE LOT COUNTS

Cape Cod Commission transportation staff and technicians perform occupancy counts at three Cape Cod Park and Ride locations (Barnstable, Sagamore and Harwich). The number of parked cars is counted, and the number of illegally parked cars is also noted. In the Park and Ride reports on the following pages, the number of cars is compared to the lot's capacity and a percentage of used capacity is calculated. The records in the database are grouped by lot then arranged from oldest to most recent during the period 2012-2021.
